

OBJECTIVE 1:-

(i) Load HVAC.csv file into temporary table

(ii) Add a new column, tempchange - set to 1, if there is a change of greater than +/-5 between actual and target temperature

(Here I load the SparkSQLUseCase1.scala and related .csv files. Here I use the IntelliJ IDEA Community Edition 2018.1.2 x64)

COMMAND:-

(i)

val data =

```
spark.sparkContext.textFile("D:/hadoopstudy/interviewsessionII/session21/HVAC.csv");
```

(ii)

```
case class
hvac_cls(Date:String,Time:String,TargetTemp:Int,ActualTemp:Int,System:
Int,SystemAge:Int,BuildingId:Int)
```

```
val header = data.first()

val data1 = data.filter(row => row != header)

println("Header removed from the data !")

//For implicit conversions like converting RDDs and sequences to
DataFrames
import spark.implicits._

val hvac = data1.map(x=>x.split(",")).map(x =>
hvac_cls(x(0),x(1),x(2).toInt,x(3).toInt,x(4).toInt,x(5).toInt,x(6).to
Int)).toDF()

hvac.show()

println("HVAC Dataframe created !")

hvac.registerTempTable("HVAC")

println("Dataframe Registered as table !")

val hvac1 = spark.sql("select *,IF((targettemp - actualtemp) > 5, '1',
IF((targettemp - actualtemp) < -5, '1', 0)) AS tempchange from HVAC")

hvac1.show()

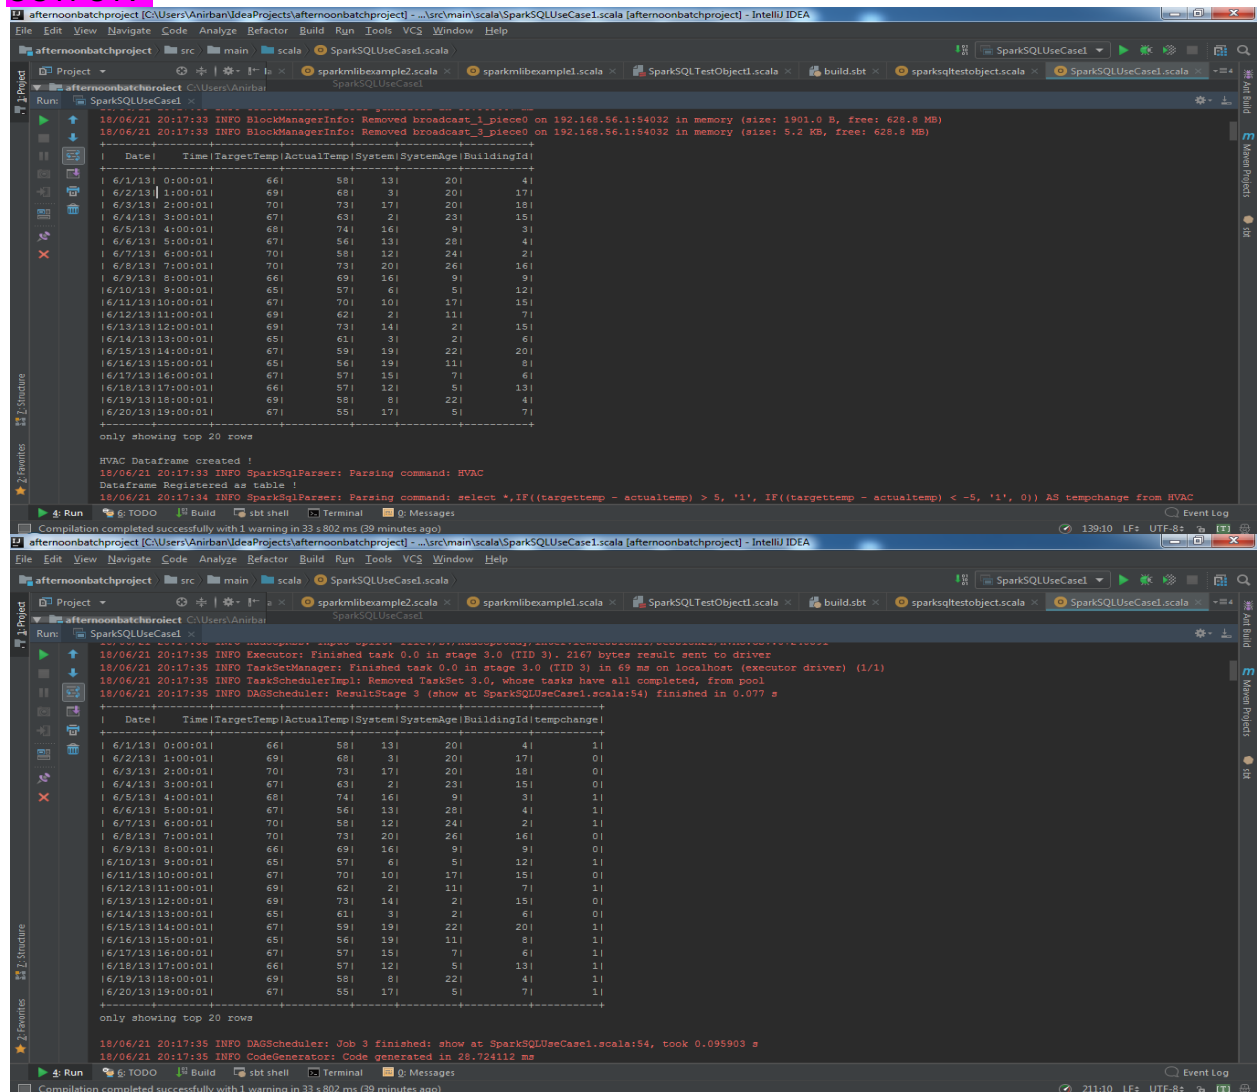

hvac1.registerTempTable("HVAC1")
```

```
println("Data Frame Registered as HVAC1 table !")
```

EXPLANATION:-

- (i) Here I load the HVAC.csv into the temporary table.
- (ii) Here I add a new column, tempchange -set to 1, if there is a change of greater than +/-5 between actual and target temperature

OUTPUT:-

```

```

OBJECTIVE 2:-

- (i) Load building.csv file into temporary table

COMMAND:-

```
case class
building(buildid:Int,buidmgr:String,buildAge:Int,hvacproduct:String,Country:String)
```

```

val data2 =
spark.sparkContext.textFile("D:/hadoopstudy/interviewsessionII/session21/building.csv"
);

val header1 = data2.first()

val data3 = data2.filter(row => row != header1)

println("Header removed from the building data")

//Now let us create the building dataframe

val build = data3.map(x=> x.split(",")).map(x =>
building(x(0).toInt,x(1),x(2).toInt,x(3),x(4))).toDF

build.show()

build.registerTempTable("building")

println("Buildings data registered as building table")

```

EXPLANATION:-

Here I load building.csv file into temporarytable.

OUTPUT:-

```

```

Buildings data registered as building table
18/06/21 20:17:36 INFO CodeGenerator: Code generated in 49.930746 ms

```

OBJECT 3:-

Figure out the number of times, temperature has changed by 5 degrees or more for eachcountry:

(1)Join both the tables.

(2)Select tempchange and countrycolumn

(3)Filter the rows where tempchange is 1 and count the numberof occurrence for eachcountry

COMMAND:-

```
(1)val build1 = spark.sql("select h.*, b.country, b.hvacproduct from building b join hvac1 h on b.buildid = h.buildingid")
build1.show()
```

```
(2)val tempCountry = build1.map(x => (new Integer(x(7).toString),x(8).toString))
tempCountry.show()
```

```
(3)val tempCountryOnes = tempCountry.filter(x=> {if(x._1==1) true else false})
tempCountryOnes.show()
tempCountryOnes.groupBy("_2").count.show
```

EXPLANATION:-

(1)Here I Join both the tables.

(2)Here I Select tempchange and countrycolumn

(3)Here I Filter the rows where tempchange is 1 and count the numberof occurrence for eachcountry

OUTPUT:-

[illegible]
